

AgriLink AI

AI-Powered Smart Market Linkage & Produce Journey Platform
Smart India Hackathon 2026 | Problem Statement ID: SIH26132

1. Our Main Mission

Help small and marginal farmers collectively access bigger markets by intelligently pooling compatible farmers' produce, matching them with suitable buyers, and providing transparency about where their produce goes.

2. Core Problem

Small and marginal farmers often have small quantities individually, while larger buyers require bulk and consistent quantities. At the same time:

- Farmers struggle to identify suitable opportunities.
- Buyers struggle to find sufficient aggregated supply.
- Individual transport can be costly.
- Farmers may have limited visibility after their produce leaves them.
- Farmers need transparency about the buyer, destination, delivery, and payment.

3. Hero Feature — AI Smart Farmer Pooling + Buyer Matching

Example scenario:

Source	Quantity
Farmer A	500 kg Tomatoes
Farmer B	700 kg Tomatoes
Farmer C	900 kg Tomatoes
Buyer Requirement	2,000 kg Tomatoes

AgriLink AI then:

- Identifies compatible farmers.
- Checks quantity, location, and availability.
- Creates a suitable pooled lot.
- Matches it with the buyer.
- Suggests shared logistics.

Result: Small farmers who cannot access a bulk buyer individually can collectively fulfil the demand.

4. Two Access Methods

Voice / Call Assistant — for farmers without smartphones

- Call the system directly.
- Give a missed call and receive a callback.
- Speak naturally in their preferred / local language.
- Receive important updates through calls.

Mobile / Web Application — for young and digital farmers

They can see and manage:

- Their registered produce
- Pooling status
- Buyer details
- Destination
- Transport status
- Delivery status
- Payment status

5. “Where Is My Produce?” Feature

The farmer can see the complete journey of their produce:

Produce Registered → Farmer Pool Created → Bulk Lot Created → Buyer Matched → Destination Confirmed → Transport Assigned → In Transit → Delivered → Payment Status

So the farmer always knows:

- **Where will my produce go?** — Buyer + destination details
- **Where is my produce now?** — Current transportation / delivery status
- **What happened to my payment?** — Payment tracking

6. Quality Verification (Optional Supporting Feature)

If a particular buyer requires a quality grade, FPO / Collection Centre staff physically verify the produce (for example, Grade A or Grade B). This avoids problems such as farmers self-declaring quality or manipulated images.

The AI can inform the farmer: *“This buyer requires verified quality information. Quality verification may make your produce eligible for this opportunity.”*

7. Shared Logistics

Once farmers are pooled, instead of everyone transporting produce separately, the system supports a shared logistics plan — making aggregation practical and reducing unnecessary transportation costs.

8. Transaction & Transparency Record

The system records the complete journey, including:

- Produce registration
- Farmer pooling

- Buyer offer
- Farmer confirmation
- Transport status
- Delivery
- Payment status
- Dispute / grievance status

9. What Makes Us Different?

Traditional Approach	AgriLink AI
Farmer searches for market on their own, sells, and loses visibility afterward.	AI finds compatible farmers, produce is pooled, buyer is matched, journey is tracked end-to-end, and payment status stays visible.

10. Final USP

“AgriLink AI doesn’t just connect farmers to buyers. It intelligently transforms fragmented produce from small and marginal farmers into market-ready bulk lots and provides transparency throughout the journey from farm to buyer.”

11. Final Feature Priority

Rank	Feature	Role
1	AI Smart Farmer Pooling	Main innovation
2	Buyer Demand Matching	Core intelligence
3	Voice Access + Mobile App	Accessibility
4	Produce Journey Tracking	Transparency
5	Shared Logistics	Practical execution
6	Optional FPO Quality Verification	Trust
7	Payment & Transaction Tracking	Accountability

12. Recommendation & Next Step

This is our final concept for SIH26132. The next step is to validate this exact idea against existing government platforms and competitors, so we can clearly prove our uniqueness in the SIH Round 1 presentation.
